ESSENCE

FRONTEND ASSIGNMENT 6 | JQUERY

Perfume Store Website | Project Report

Manyakina Yuliya • Bazarbayev Bakdaulet | SE-2509

Astana IT University | November 2026

PROJECT OVERVIEW

ESSENCE is a responsive, four-page perfume store concept built with HTML, CSS, JavaScript and jQuery. The design uses a warm cream palette, elegant typography and simple interactions.

Deployed website (intended GitHub Pages URL): https://koldockw.github.io/jqu/

Note: the URL is included as requested. Publishing and verifying the live site must be completed separately.

PAGES AND STRUCTURE

Home (index.html): hero section, animated welcome text and number counter.
Perfumes (perfumes.html): live search, autocomplete, highlighting, category filters and wishlist notification.
About (about.html): team introduction and Read more animation.
Contact (contact.html): validated demo form, loading indicator and notification.

PROJECT FOLDERS

css/style.css: all responsive styling.
js/common.js: progress bar, clipboard and toast.
js/data.js: sample product data.
js/products.js: search, autocomplete, filters and highlighted matches.
js/home.js: counter and fade-in.
js/about.js: Read more.
js/contact.js: loading and form validation.

JQUERY FEATURES AND TEST CASES

jQuery setup

jQuery 3.7.1 CDN is linked in each page. All interactions run inside $(document).ready().

Live search

Typing “Dior” immediately shows the Dior product without reloading the page.

Autocomplete

Typing part of a name shows up to four matching suggestions. Clicking a suggestion fills the search input.

Highlighting

The matching part of the product name is wrapped in a mark tag.

Scroll progress

The thin line at the top grows as the visitor scrolls down.

Animated counter

The home page increases a demonstration counter from 0 to 100.

Loading spinner

Submitting a valid contact form shows “Loading...” before a demo success message.

Notifications

Wishlist buttons, contact form and clipboard actions display temporary toast messages.

Clipboard

Copy page link copies the current URL using navigator.clipboard. Secure context may be required.

Responsive layout

The grid changes from three columns to two and then one on smaller screens.

TEAM CONTRIBUTIONS

Manyakina Yuliya | beginner-friendly tasks

Created the content and structure of the About and Contact pages, prepared the basic page content, and implemented simple jQuery actions: fadeIn(), slideToggle(), text() and a number counter using setInterval(). Also helped with toast and clipboard interface elements.

Bazarbayev Bakdaulet | advanced tasks

Built the dynamic product catalogue and filtering logic, implemented real-time search, autocomplete suggestions, highlighting, scroll progress and contact form loading behavior. Integrated all scripts and responsive layouts.

HOW THE CODE WORKS

HTML defines the content and elements. CSS styles the layout and adapts it to different screens. jQuery selects elements using $(), reacts to events using .on(), and changes the page without reloading. The product list is a JavaScript array in data.js. The contact form is a demo and does not send data to a server.

DEFENSE PREPARATION

Explain the purpose of each page, demonstrate search and filters, click Read more, submit the contact form and copy the page link. Discuss the division of work and show the individual JS files.

SCREENSHOT CHECKLIST

Before submission, capture screenshots of all four running pages and the corresponding source code. Add them to the report if your instructor requires screenshots. No screenshots have been fabricated in this report.
